

Safety Infrastructure for Fleet Mobility

Tracking tells you *where*. Monitoring tells you *how*.

The Problem

Every fleet owner in India says the same thing: **"I know where my vehicles are. I just don't know what's happening inside them."** That gap is costing Indian fleet businesses crores every year — in accidents, wasted fuel, inflated insurance premiums, and unchecked driver behaviour.

Most fleet management tools available today are simply GPS trackers. They show a dot on a map. That dot doesn't tell you how your driver is driving — and it certainly doesn't prevent accidents.

Tracking vs. Monitoring

GPS Tracking	Safar Monitoring
Vehicle is at Sector 18, Noida. 3:42 PM	6 harsh braking events in the last hour
Route completed. Destination reached.	Speed exceeded 80 km/h on a school zone stretch
Trip duration: 2 hrs 14 mins	Engine idling 23 mins = Rs. 340 wasted fuel
Signal lost near highway overpass	Route deviated 4.2 km from assigned path
—	Fatigue pattern detected after 9 PM

What Safar Does

Safar is a real-time driver behaviour monitoring platform that uses the driver's **existing smartphone** — no GPS hardware, no installation, no IT setup required.

Harsh Braking Detection	Sudden deceleration events flagged in real time using smartphone accelerometer data.
Speed Pattern Analysis	Continuous speed monitoring with alerts for school zones, highways, and restricted areas.
Engine Idle Tracking	Real-time idle detection translated directly into fuel cost waste per driver.
Route Deviation Alerts	Assigned vs actual path comparison with instant deviation notifications.
Fatigue Detection	Pattern-based analysis for night drivers to prevent micro-sleep risk windows.

Real-Time Safety Scoring	Every driver receives a live safety score updated continuously throughout each trip.
--------------------------	--

Three Stakeholders. One Platform.

Fleet Owners	Drivers	Insurance Companies
Real-time dashboard. Reduce accidents, fuel waste & liability.	Personal safety score on their existing smartphone.	Telematics data API for UBI-based premium pricing.

The Insurance Advantage

Safar bridges the data gap between fleet operations and insurance pricing. Indian insurers currently price fleet premiums on vehicle age, city, and driver history — all static proxies. Safar provides **ground truth driving data** that enables:

For Insurance Companies

- Accurate risk pricing based on actual driving behaviour — not estimates
- Usage-Based Insurance (UBI) product development for the Indian fleet segment
- Fraud detection: verify claims against timestamped, sensor-level trip data
- Faster claim settlement with complete incident timelines

For Fleet Owners & Drivers

- Fleets with high Safar safety scores qualify for reduced insurance premiums
- Verifiable safety history built over time — usable in contract negotiations
- Faster claim settlement when incidents occur — driver data protects you

Pilot Implementation Plan

Phase	Timeline	What Happens
Phase 1: Discovery	Week 0	Fleet structure, shift patterns, and incident response expectations are mapped.
Phase 2: Configuration	Week 1	Roles, routes, escalation workflows, and reporting templates are configured.
Phase 3: Pilot Launch	Week 2–3	Selected vehicles and teams go live with supervised operating reviews.
Phase 4: Scale Decision	Week 4	Pilot outcomes reviewed jointly before phased rollout planning begins.

We are onboarding our first 10 pilot fleet partners — completely free.

If you manage vehicles in India and want real-time monitoring without any hardware investment, let's talk.
